Kelly Pneumatics, Inc. offers a reduced cost, single or dual-valve design, Electronic Pressure Regulator with I/P transducer control circuitry. This electronic pressure regulator is designed specifically for high volume flow rates, and precisely controls both positive and negative outlet pressure ranges, even during dynamic changes in outlet flow rates. By utilizing either an externally supplied dynamic/static input signal or an on-board adjustable set-point value, the High Flow Precision Regulator provides exceptional closed-loop, proportional, output pressure control characteristics. Our electronic pressure regulators offer significant improvements over traditional dual on/off valve electronic regulators. Utilizing our patented proportional valve design for both internal fill and dump valves gives a smooth and accurate output pressure, as opposed to dual on/off valve designs that cause substantial shock waves in the regulated pressure signal.
